# Ground textures — all generated

19 source materials replace the terrain and low ground-cover textures; placement and terrain geometry are unchanged.

**PREVIOUS FOREST FLOOR**

**GENERATED REPLACEMENT**

Actual world, same site, ground camera and Medium vegetation. Existing ecological colours and material blending are retained.

## Grass detail

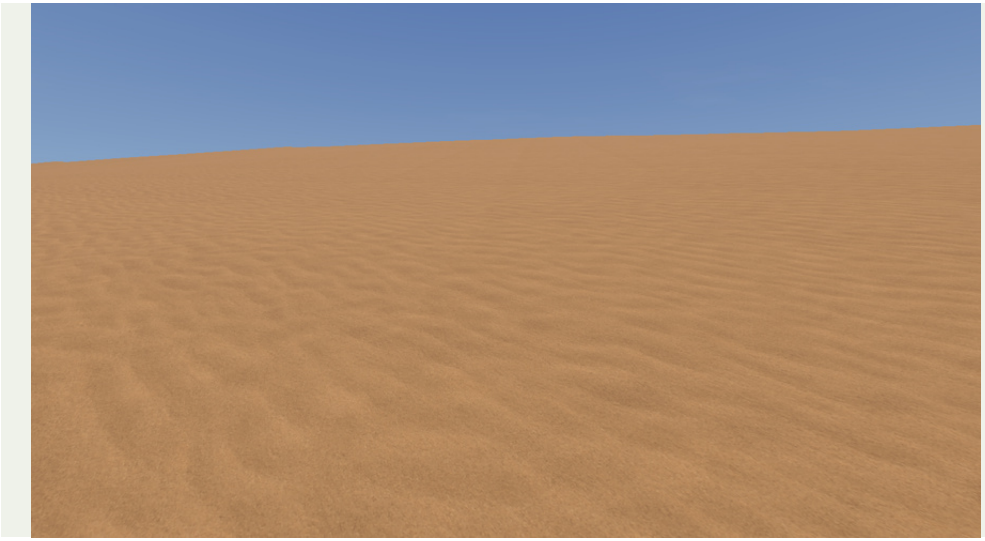

The generated grass surface has readable blades and thatch. This image is an isolated flat plane using the production terrain shader; physical grass geometry is unchanged.

**Scope:** soil, sand, gravel, clay, organic earth, salt and ice; six rock families; three forest floors; grass, moss and lichen. The existing generic rock slot shares granite.

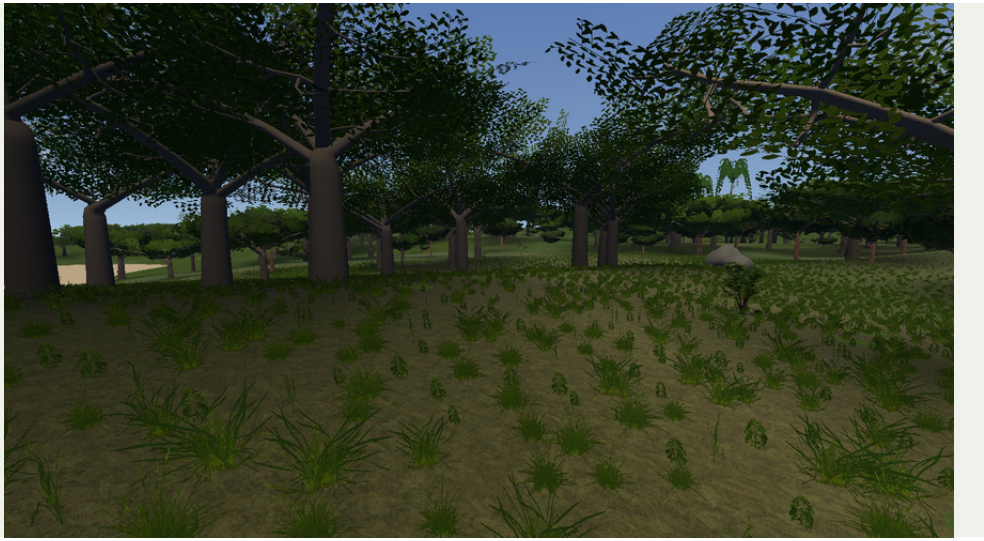

**Delivery:** the shortcut selects the verified new build. Relaunch an already running older session to see the new materials.

# In the world

Actual generated landscapes, Medium vegetation. These views check material integration, not an uncontended FPS benchmark.

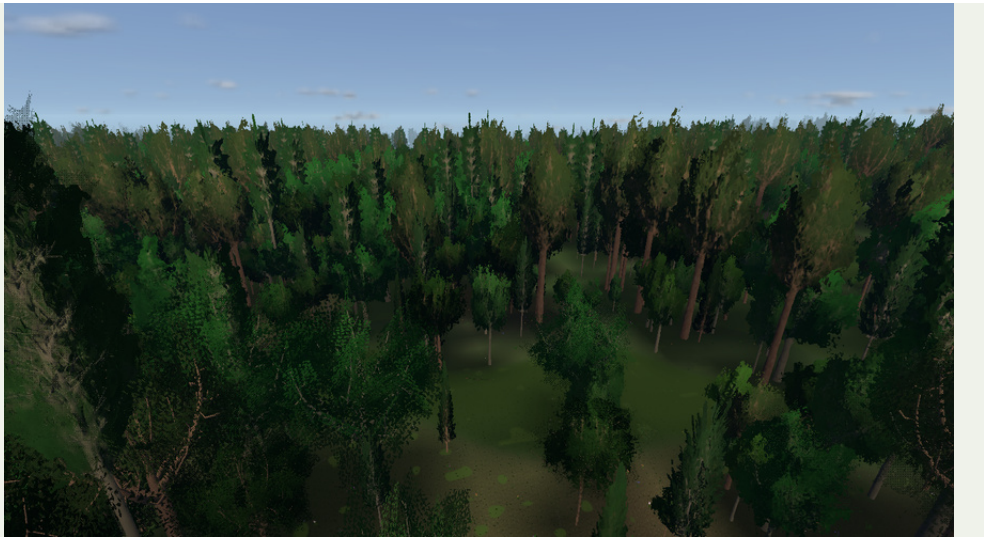

Sand: fine grains and gentle ripple detail

Wooded savanna: grass/soil detail under existing plants

Limestone upland: local rock and ground blends

Forest: generated floor within the existing vegetation

# The material set

Generated base-colour masters, before neutral mean preparation and the game's ecological/geological tint.

**Mineral soil**

**Sand**

**Gravel**

**Clay**

**Granite / generic rock**

**Basalt**

**Sandstone**

**Limestone**

**Mudstone**

**Metamorphic rock**

**Organic earth**

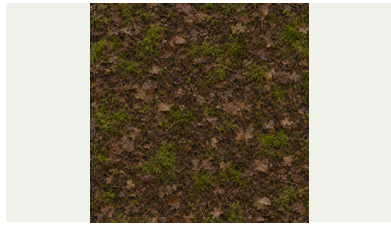

**Ice / firn**

**Broadleaf litter**

**Needle litter**

**Damp mixed litter**

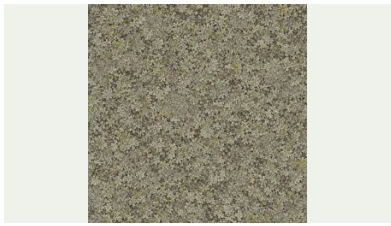

**Salt crust**

**Grass surface**

**Moss cushions**

**Lichen crust**

**Verified:** 462,697 layout, repeat-mip, unit-normal, linear-light and production-shader checks. All 17 terrain slices are replaced; the terrain texture payload remains **28.69 MiB** (1024 / 512 / 128 BC7 arrays). No shader passes or samples added. The 256px lichen map replaces its procedural RGBA32 counterpart with BC7.

**Limits:** relief, occlusion and roughness are conservative authoring approximations derived from colour, not measured PBR. No displacement or new terrain shapes. No FPS claim while the owner's separate game session was running.
