Inherited appearance

Individually shaped people, regional ancestry and cultural grooming. Native portraits in controlled lighting.

Generated NPCs now carry persistent skin, hair and iris pigmentation, facial proportions, stature and build. Relatives resemble each other; regional populations retain shared traits alongside individual variation.

Layer	What it controls
Inherited traits	Pigmentation, hair texture, facial proportions and potential adult stature.
Cultural grooming	Six overlapping categories: cropped, short, long, tied, braided and shaved.
People identity	A persistent identity separate from culture and political ownership.

These six portraits are real generated residents sampled from the saved world, using their own names and inherited profiles.

Independent, adjustable traits

Synthetic parameter controls on one shared base rig. These examples are not named ethnic presets.

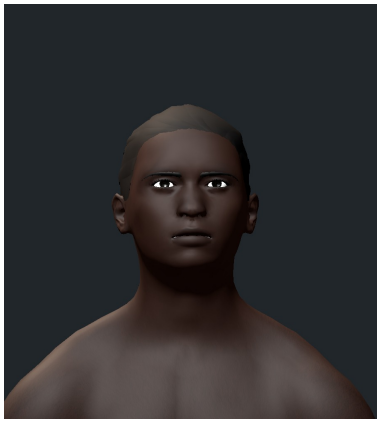

Fair hair / blue irises

Curly hair / green irises

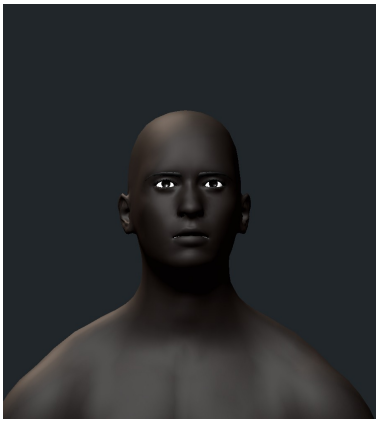

Narrower facial proportions

Tied hair / eyelid-fold variation

Broader brow and jaw / braid

Shaved scalp / darker pigmentation

Twelve anatomical morph axes shape the face and build. Hair is fitted separately to the same head. The simulation supplies inherited ranges; cultural preferences supply the grooming distribution.

In game	Implementation
Families and regions	Deterministic individual variation around regional means, with biological-parent resemblance.
Human species	Species stature provides the broad baseline; within-sapiens variation stays much narrower.
Cost	Personally shaped full, middle and far meshes are baked once when a character loads. No active runtime blendshapes.

The existing rigs, motion banks and source texture art are retained. No character-creation menu is added in this pass.

One identity across gameplay

Actual-world embodiment, clothing, inventory and saved NPC context.

The embodied resident, inherited portrait, fitted coat and retained tools.

Controlled gathering: 100 sampled people from seven bands.

The inherited person is used in the world, first person, the inventory portrait, local NPC memory and save files. Dialogue context receives the actual hair and eye description.

Verification	Result
Inheritance and identity	5,810 core checks; family variation, cultural independence, copying and bounded species size.
Native portraits	716 checks /30 profiles /120 poses; actual combat skins agree with bone matrices within one micrometre.
Played-world integration	19 checks: embodiment, camera/capsule height, portrait anatomy and pigmentation, clothing, full session serialization.
Existing gameplay	184 combat/item, 35 clothing and 86 animation checks passed.
100-NPC close crowd	118.6 /117.8 FPS; p99 ~11.6 ms; longest frames 22-29 ms. Strict 100-FPS floor remains unmet.

Crowd: medium 1080p, 6 km view and four 30-second windows, with Chrome/video in use. Original source art is retained. Fuller beard variants and individual limb proportions remain future work.
