People, camps and daily life

What is implemented, what the screenshots show, and what still needs work.

A generated woodland camp: household lean-tos, cleared floors, hearths and residents.

A community foundation

Human groups now appear from the world simulation, with named residents, households, camps and daily routines. Their location and way of life come from regional data; they are not a crowd spawned around the player.

World-derived

Species, culture, language, belief and known techniques inform local communities.

Local detail

Lightweight group tracking extends to 50 km; bodies, homes and activities appear nearby.

Repeatable

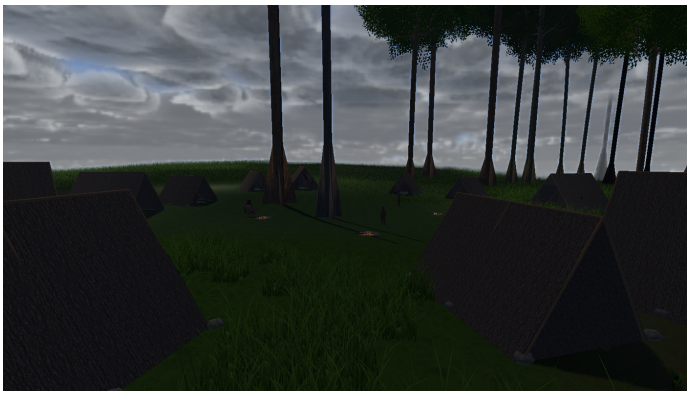

Seeded identities and itineraries reproduce unvisited groups. Consequential local changes are saved.

First pass

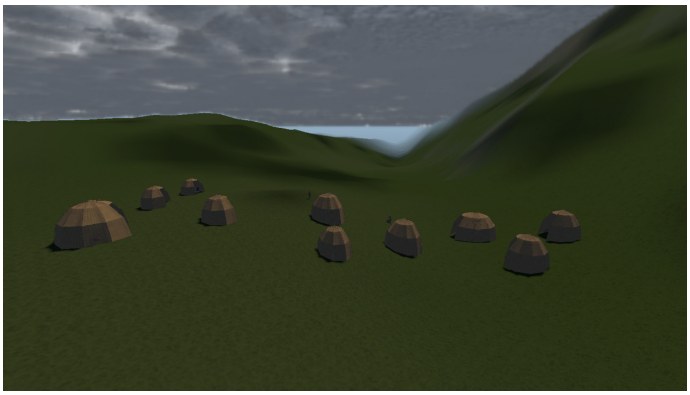

This is a procedural scheduling foundation. Dialogue, NPC hunting and a complete economy remain deferred.

Different camps, different lives

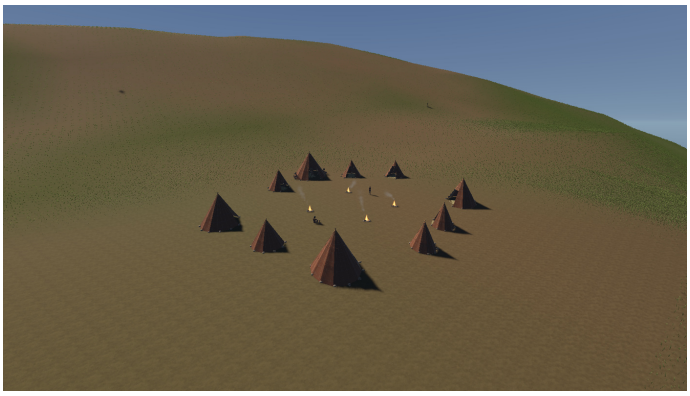

Shelter form, covering and residence patterns respond to the community and its environment.

Wet-region seasonal base: 42 people, 12 bark-covered ridge shelters.

Collector camp: 41 people, 10 rounded brush shelters. Some task shots reveal clipping.

Cold-region camp: 37 people, 10 hide tents. NPC clothing is not implemented.

A long-stay waterside community at night: brush shelters and shared hearths.

More than a village template

Camps combine household shelters, hearths and bedding using the same material-backed objects as player construction. Footing surveys avoid cliffs, water, trunks and boulders; occupied floors clear grass. Seasonal bases, mobile camps and dependable waterside bases have different stays and journeys.

A whole community need not be standing at home: work parties can be away. The population listed in captions is the community total, not a requirement for everyone to crowd the screenshot.

A day of work

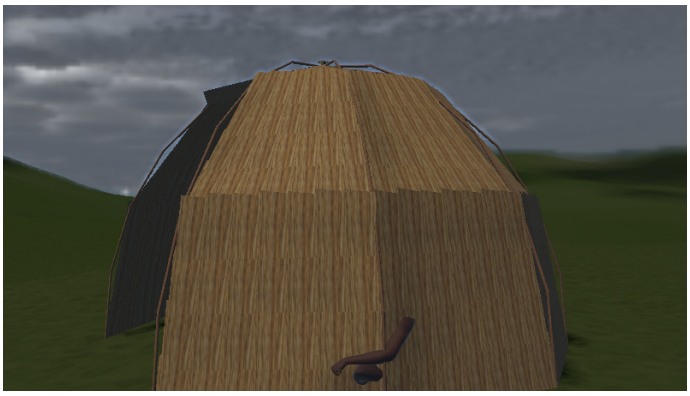

Schedules choose activities; residents move between home, work areas and short gathering trips.

Craft assignment (detail crop). A resident is still moving into place beside a seated household member.

Shelter-maintenance assignment (detail crop): a simple standing work pose beneath the lean-to.

Food-preparation assignment: this shot exposes an arm clipping through the covering.

Plant-gathering assignment (detail crop): residents carry baskets while moving between work and camp.

What changes the routine?

Local daylight, weather, age, skills, family care and culture influence the schedule. It includes fuel and plant gathering, water trips, craft work, shelter maintenance, food preparation and learning. Hot conditions can prompt rest; heavy rain can redirect work toward shelter.

Current limit: these are movement, pose and prop routines, not a complete production/consumption simulation. A task label can describe someone heading to work; it does not prove that the pictured action has already started.

Families and shared time

Residents have persistent identities and household relationships rather than interchangeable villager roles.

Childcare assignment (detail crop). The carer uses a seated pose; detailed care gestures are limited.

Infant/carer arrangement (detail crop): the seated infant rests beside its carer.

Child assigned to play (detail crop). Children have age-specific bodies; this frame is a standing moment.

Evening household gathering (detail crop). Children and adults share the fire-lit social area.

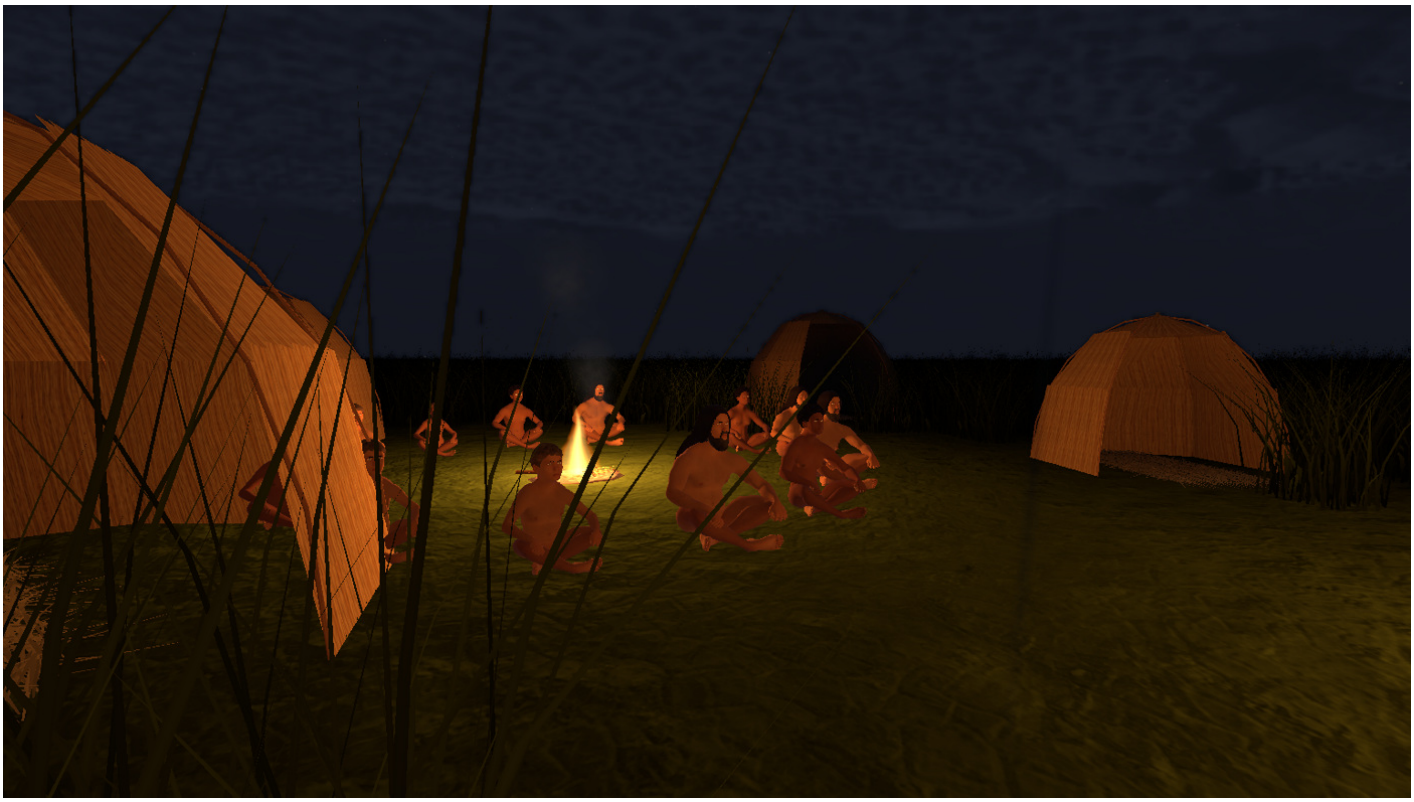

People behind the crowd

Names are derived from the group's language. Household records include parent, partner and child links; ages and skills affect responsibilities. Children use age-specific bodies, infants have carers and carrying arrangements, and adults can share care or teaching duties. Work is not universally locked to one sex or a single permanent chief.

Evening routines can gather households around shared hearths. Rest and sleep follow daylight, individual variation and age, rather than sending everyone to bed at the same instant.

Moving camps, remembering people

The current foundation supports return visits; the screenshots also expose unfinished visual work.

Socialise assignments at shared hearths. These seated routines do not yet include spoken dialogue.

Movement and persistence

A dated itinerary covers occupation, packing, travel and setup. Packing removes shelter components; the next camp begins partially assembled. Old hearths and bedding can remain as decaying traces. Reliable waterside bases can stay occupied. Families retain their identities through these moves; wounds, aggression/trust and edited camp objects survive current-version saves.

What this screenshot pass found

The numeric checks pass, but images expose limbs crossing hut coverings, overlapping household poses and some grass-blocked or mid-transition shots. Work and play poses are still generic, and dark interiors obscure detail. These remain visual issues; this is not a clean visual acceptance.

Try it in the game

/camps lists nearby communities. **/camps N** inspects one; **/camps visit N** visits it. F3 inspection identifies residents and their scheduled task.

Six scenes / 108 mechanical checks passed; 14 images selected. Captures use the selected f5385a89 build and actual simulated communities at diagnostic visit times. Original exposure is retained; labelled crops reframe only. No gameplay changes were made.
