Cliff materials & cleaner walls

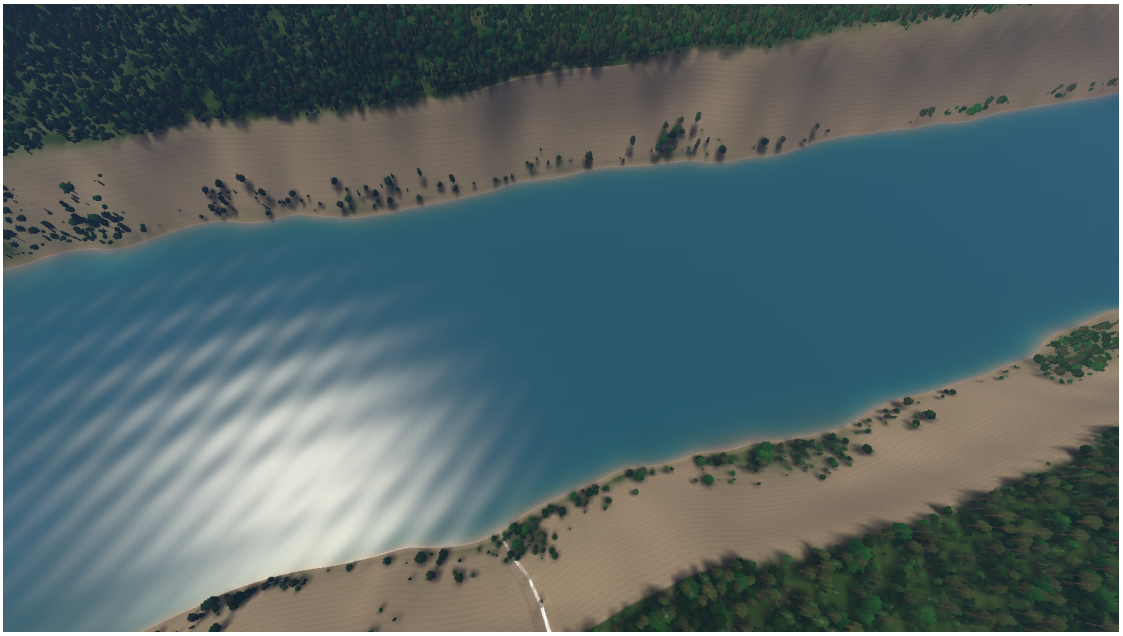

The rock texture direction is retained. The oversized cliff-scatter masses and repeated cellular carving are removed.

EARLIER CLIFF EXPERIMENT

Earlier version: large attached rock masses stand apart from the valley walls.

CURRENT REVISION

The same fjord after cleanup. Ordinary trees, boulders and natural outcrops remain.

The extra distance fade was also retired: it made the rock surface too flat in wider views. The generated material now retains its detail through normal texture mipmapping.

Continuous rock surface

Actual game capture in the wooded fjord. The wall material no longer depends on covering the terrain with large scatter meshes.

Current exposed rock: continuous layered texture, with ordinary vegetation and small rocks still present.

Validation	Result
Actual canyon surface seams	176 assertions passed
Adaptive terrain planning	1,403 checks passed
Canyon scatter reconstruction	0 synthetic cliff masses; 292 ordinary rocks
Final wooded-cliff review	48 runtime/scene checks passed; interactive review remains open
Frame-rate comparison	Deferred while another game is running; no new FPS claim

Scope: two generated cliff material families, about 3.33 MiB of shared texture data. No new terrain mesh layer or render pass. The approved close texture is retained.

Still to do: better integrated ledges and overhangs, plus refinement of visible repetition on long uniform walls. The global 100 FPS goal is not signed off. The main shortcut remains on the protected previous build; this review uses slot B.
