Social life without a backlog

Local interactions have procedural outcomes. Generated dialogue is an optional audible layer.

Interaction	Behavior
Company & gossip	Local people spend time together without model requests. Some encounters affect relationships; recent witnessed events can spread as reports.
Reliable information	Reports retain their origin and date, lose confidence when forwarded, and do not become personal eyewitness memories. Duplicates do not farm trust penalties.
Nearby speech	Model dialogue starts only within earshot (10 m), subject to substantial barriers. Small objects do not mute voices. Brief occlusion has a two-second grace for work already in progress.
Player priority	Busy background requests are rejected; stale narration is discarded. Player dialogue interrupts incidental reactions, including those from the same NPC.

Actual Qwen exchange between Nusa and Natot, followed by the player interrupting. The existing thoughts overlay shows the active intention and queue. Actor positions were controlled for functional testing.

Verified

87 Core checks passed, plus all 26 final packaged social checks and 14 packaged safety checks. Tests include AI-disabled gossip outside earshot, obstruction, no backlog under thirty incidental requests, live streaming, turn-taking, player interruption and saved-state validation.

Scope

Only loaded local people take part; no world-wide simulation of individual conversations. Model speed and prose quality are unchanged. These are functional checks, not evidence of an FPS gain.
