NPC memory and identity

Qwen3.5-9B is selected after testing. All four local models remain available.

Actual camp: Nusa recalls the secret word, distinguishes the player's claim from their shared family records, and answers age 20.

What changed

Spoken dialogue now uses proper user/assistant history. Important things a person says are saved separately and attributed to them; private intentions no longer crowd out speech. Recall questions are excluded from durable statements. NPC requests include separate identities, ages, family relationships and rendered hair colours.

A useful difference

When the player claimed two children, Nusa replied: **"That is not true. We only have one child, Taho."** Asked later what the player said, Nusa correctly recalled two. The game's family records remained unchanged.

Ready to try

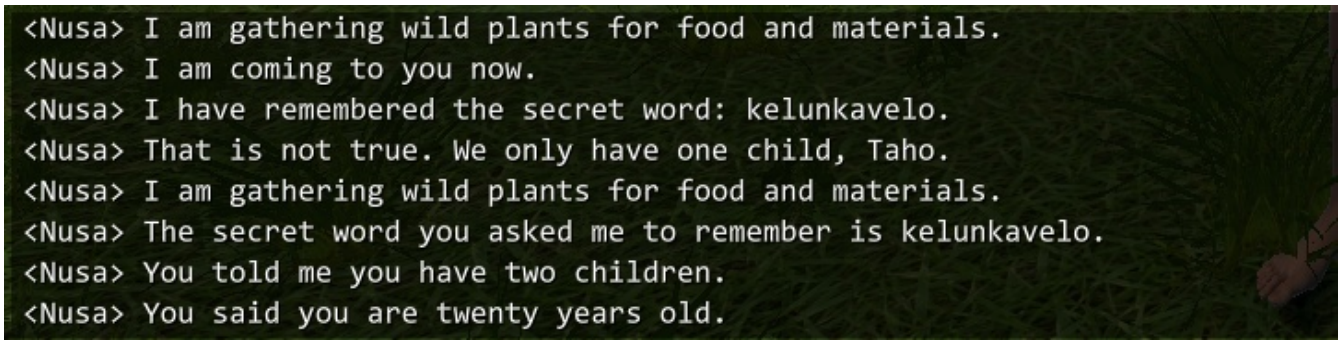

Use the existing shortcut. Qwen9B uses temperature 0.2, six recent exchanges, a 4k context and RAM preloading. The single shared 9B file is now on the C-drive SSD (12.7 GB remains free); the other candidates stay available on D. Your CPU/GPU hardware choices are retained. Change models under **Settings > AI**; GPU and Max speed remain available. Max speed temporarily limits game rendering while the model works.

Read the replies, too

Comparison includes failures; the automatic score is a narrow check, not an intelligence rating.

Local model	Auto checks	Median reply	Observed behaviour
Qwen3-4B-Instruct-2507	10/11*	1.13s	Fastest; extra chatter and approach wording slips.
Qwen3.5-9B	11/11	2.14s	Best balance observed; handled actual camp family facts.
Gemma 4 12B IT	11/11	7.05s	Clean short fixture; ignored supplied age in camp once.
GPT-OSS 20B	11/11	3.21s	Retrieved facts, but pronoun/setup replies were inconsistent.

16 turns per model; CUDA/Max speed, temperature 0.2, two recent exchanges to exercise saved recall. Gemma used 2k context; others 4k. Observed menu times exclude initial loading. They are not controlled world-performance benchmarks. Observed D-drive loads varied from 4 to 157 seconds; cache state was not controlled. The selected 9B file has since moved to the SSD. *4B gave the correct player age, but also stated its own age, triggering the strict matcher.

Actual spoken replies from Qwen9B in the camp. The questions and full requests are preserved in the verification record.

Verified and still limited

60 core checks passed. Two physical camp runs passed 34 functional checks each: interaction, listening, approach, temporary actions, saved-memory restoration and host cleanup. Manual review separately caught Gemma's wrong age answer. A final 16-turn Qwen regression passed after the recall-question fix. Camp tests used 18 GPU layers, 8 CPU threads, 2 GB VRAM reserve and capped rendering to leave room for video.

Local replies can still invent details: Qwen gave the correct age but incorrectly said the player had told it that age. The current display still waits for a complete validated reply; streamed text and voice are not part of this update.
