Four models, one AI tab

Switch local NPC models without rebuilding the game or duplicating their weights.

Actual AI settings: all four installed models, resource presets and CUDA/Vulkan selection.

Try a model

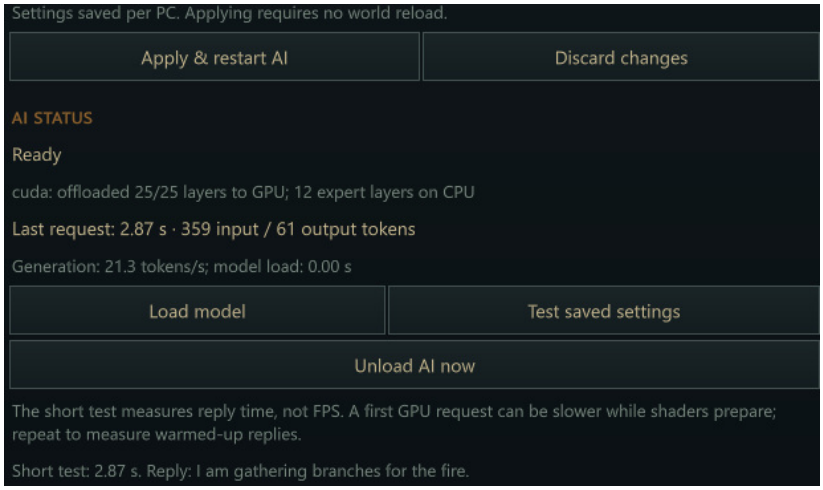

Open **Settings > AI**. Choose a model and a hardware preset, then **Apply & restart AI**. Use **Load model**, followed by **Test saved settings**. Repeat the short test after loading. The same selection is used by NPC conversations and event-driven thoughts.

Model	Weights	Role in comparison
Qwen3-4B-Instruct-2507	2.3 GiB	Existing fast baseline
Qwen3.5-9B	5.3 GiB	Larger dense-model trial
Gemma 4 12B IT	6.6 GiB	Alternative larger dense-model trial
GPT-OSS 20B	10.8 GiB	Expert model, with adjustable CPU/GPU split

The three additional models remain in **D:\WorldGenModels\NpcAI**. D is a mechanical drive, so initial loading can be slow. Keep one shared copy; after comparison, delete losing candidates and consider moving the winner to C. Your existing saved AI profile was preserved.

Give AI the resources

Ordinary presets remain available. Max speed deliberately trades rendering smoothness for inference.

Actual GPT-OSS status. Layer offload includes GPU attention; 12 expert layers intentionally remain on CPU.

Warmed short task	CUDA tokens/s	Vulkan tokens/s
Qwen3-4B	61.7	63.3
Qwen3.5-9B	34.2	29.8
Gemma 4 12B	14.0	16.7
GPT-OSS 20B	21.3	19.5

One repeated short menu prompt per model/backend; 298-359 input tokens with model-specific tokenization. Brief structured replies, 2,048 context, Ryzen 5700X / RTX 4060 8 GB / 32 GB RAM. These samples establish usable output, not an intelligence ranking or gameplay FPS guarantee. A full scene can leave less GPU memory available.

Control	Effect
Max speed	High CPU priority, 8 generation / 16 prompt threads on this PC, active polling, and 15 FPS while AI works. Normal FPS and VSync return afterward.
VRAM reserve	GPU preset: 1,024 MiB. Max speed: 512 MiB. Manual 0 remains available; memory spill can make it slower.
Expert split / preload	GPT-OSS starts with 12 expert layers on CPU, with explicit RAM loading. Both controls remain adjustable.
Backend / threads	Compare CUDA and Vulkan. More workers or more offload do not always produce a faster reply.

Verified: 70 settings checks across all eight model/backend combinations, plus 18 in-world NPC checks with Qwen3.5-9B. Current presentation uses complete validated replies; streamed speech text remains a separate next step. Switching and unloading release the single model host.
